Message

I am happy to know that Bangladesh Bureau of Statistics (BBS) under Statistics and Informatics Division (SID), Ministry of Planning is going to publish the Yearbook of Agricultural Statistics-2019 in due time. It is encouraging to note that the capacity of BBS has increased greatly in timely publishing of its reports under the overall guidance of SID.

It is worth mentioning that the economy of Bangladesh depends largely on the broad agriculture sector, which includes inter alia, agriculture, fisheries, livestock and forestry. Timely and reliable statistics is indispensable for policy formulation of this sector. I believe that the Yearbook of Agriculture Statistics-2019 will provide data significantly with the policy makers and other stakeholders in this field and measuring respective goals of SDGs.

I would like to thank Mr. Saurendra Nath Chakrabhartty, Secretary, Statistics and Informatics Division (SID), Ministry of Planning for his initiatives in publishing this report timely.

I also appreciate Mohammad Tajul Islam, Director General, BBS and his colleagues for preparing and publishing this Yearbook at the shortest possible time.

FOREWORD

The agricultural and rural sector in Bangladesh has a particular importance for the sustainable food and livelihood security of its large, dense and ever-growing population. The agricultural activities in the country are pursued intensively for the crop as well as allied sectors, and in conditions of scarce natural resources. The performance of this sector has a great impact on macro-economic situation like employment generation, poverty alleviation, food security and nutritional attainment etc.

I deeply feel that statistics has been playing an ever-increasing role in shaping up and providing scientific information that is useful in almost every aspect of human life. Agriculture statistics is a major concern not only for Bangladesh but also for the world as a valuable assistance for formulation of appropriate policy and strategic plan in boosting up the food security and rural development. It is praiseworthy to mention that Bangladesh has a strong agriculture structure which has enabled the country to achieve food sufficiency.

I am happy to know that Bangladesh Bureau of Statistics (BBS) is going to publish the Yearbook of Agricultural Statistics-2019 which is 31st issue in the series. This annual publication highlights data on crops area and production, crop damage, weather indicators, agricultural inputs, livestock, fisheries, forestry, prices of selected crops and export-import data on agricultural products.

The Yearbook of Agricultural Statistics-2019 covers a wide spectrum of statistics and indicators belonging to several thematic topics to serve as a reference guide to policy-makers, economists, analysts, academics, educationists, researchers and other users. I hope this publication will be very useful in understanding the wide variety of perspectives of this sector.

I appreciate the work carried out by BBS and would like to express my sincere thanks to Mohammad Tajul Islam (Additional Secretary) Director General, BBS for his active stewardship in this case. I also acknowledge hard work and the sincere efforts of officials of Agricultural Wing of BBS who were involved in this exercise. I expect that the users will continue providing valuable feedback and suggestions for further improvement of such publication since BBS has been striving for excellence.

PREFACE

The Yearbook of Agricultural Statistics is an annual publication of Bangladesh Bureau of Statistics (BBS). This publication attempts to portray a wide spectrum of Agricultural data and information in a comprehensive and systematic manner. This Publication contains Agricultural Statistics on estimates of crop production, crop damage, meteorological infomation, agricultural inputs, results of Agriculture Census, livestock, forestry, fisheries, crop prices, monthly wage, land use, irrigation, exports and imports of agricultural products & inputs etc. The Publication provides annual estimates of area and production of more than 126 crops (major and minor) among which 6 are major crops (Aus, Aman, Boro, Wheat, Potato and Jute). Both objective (collection of data from field) and subjective (collection of data through farmers' interview) methods are used for crop estimation. For considering the major crops estimation these methods are used as process of crosschecking.

The limitation for preparing this publication is that data produced by the other agencies are not always available in time and in suitable form. Sometimes it requires to rearrange data for inclusion in the publication.

My sincere thanks and gratitude to Mr. Saurendra Nath Chakrabhartty, Secretary, Statistics and Informatics Division (SID), Mr. Md. Shahidul Islam, Additional Secretary (Administration), Ms. Mahmuda Akther, Additional Secretary (Informatics), Mr. Khalil Ahmed, Additional Secretary (Development), SID for providing their proper guidance and support in preparing this publication.

I would like to thank to Mr. Ghose Subabrata, Deputy Director General, BBS for his support and cooperation to prepare the publication and I also would like to thanks to PDs-Editors Forum of BBS and Report Review Committee of SID for their prudent guidance in bringing out the publication.

My sincere appreciation and gratitude to Director, Joint Director, Deputy Directors, Statistical Officers as well as all relevant officials of Agriculture Wing for their relentless efforts for preparing this publication in time.

I would like to convey my thanks and gratitude to all stakeholders' Ministries/ Divisions/ Departments/ Agencies for their continous support to provide the required data in time.

I hope this publication will be very useful to the policy makers, researchers, NGOs, academics, development partners and other users to enrich the policy towards the agricultural development of the country.

Comments and Suggestions for further improvement of this publication will be highly appreciated.

Mohammad Tajul Islam

Executive Summary

The agriculture sector plays an important role in economic development as well as food security of this highly populated country. Historically, agriculture sector has been prominent for long in Bangladesh. Reliable Statistics is key to proper planning and successful implementation of activities of all sub-sectors of agriculture.

Bangladesh Bureau of Statistics (BBS) provides reliable production statistics of crops for six major and more than one hundred minor crops since its inception in 1974. BBS also provides bulk of data on crop sub-sector conducting Agriculture Census that is mainly concerned with crop data and limited data of fisheries and livestock sub-sectors. According to Statistics Act 2013, agriculture census will cover all crops, fisheries and livestock sub-sectors with due importance.

The Yearbook of Agricultural Statistics is published annually by the Agriculture Wing of BBS. It is the single largest source of agricultural statistics. This is the 31st series of Yearbook of Agricultural Statistics. The major parts of yearbook are the findings of survey and census conducted by BBS. The relevant statistics that is collected from secondary sources are also incorporated in the Yearbook.

The time series data (five year) on annual production estimates like area under crop, yield and total production of six major crops (Aus, Aman, Boro, Wheat, Potato &Jute) and one hundred and twenty minor crops have been published in this yearbook. The crop summary indices and crop damage statistics are also shown.

The statistics of other areas of agriculture sector that are published in the yearbook are; agro-ecological information of the country, land types, soil classification, crop seasons, land use statistics, meteorological information like rainfall, temperature, humidity, major cyclonic storms, agricultural inputs, statistics of livestock, fisheries and forestry, crop prices, export and import data of agricultural products and inputs and major findings of agriculture census-2008.

The extensive coverage of the Yearbook of Agricultural Statistics has increased the usefulness and importance of the book to the policy makers, researchers and all relevant stakeholders.

Chapter 1

INTRODUCTION

1.1 Introduction

Bangladesh is predominantly an agrarian country. Due to its very fertile land and favorable weather, varieties of crop grow abundantly in this country. Agriculture sector contributes about 14.23 percent to the country's Gross Domestic Product (GDP) and employs around 40.60 percent of total labour force.

In order to determine evidence-based policy initiatives, agriculture related statistics are essential. The Yearbook of Agricultural Statistics of Bangladesh is an annual publication and source of this kind of statistics. Agriculture Wing of BBS accumulates, compiles and disseminates current crop statistics and other agriculture related data. This Yearbook contains data on crop acreages and production, crop damage, weather variables, agricultural inputs like seeds, fertilizers, agricultural labour wages, irrigation, agriculture holdings, livestock, fisheries, forestry, prices of selected crops and statistics of export-import of agricultural products etc. The objective of this regular publication is to meet the user's demand of current agricultural statistics.

1.2 Method of Crop Production Estimation

1.2.1 Agricultural Statistics

Agricultural statistics consist of structural and annual statistics. The structural statistics are generated collecting data through full count/sample census normally at a regular interval of ten years as per FAO guidelines. The annual agricultural statistics are generated through annual /periodic sample surveys.

The Annual Agricultural Estimation System

The annual agricultural statistics system is designed to:

- Prepare estimate of acreage, yield per acre and production for 126 crops grown in the country ;
- Estimate of crop damages caused by floods, cyclonic storms and other natural calamities;
- Prepare monthly agriculture labour wage rate based on monthly agriculture labour wage survey.
- Prepare annual land utilization and irrigation statistics by districts. Prepare Irrigation statistics of different crops and crop details.and
- Compile the Yearbook of Agricultural Statistics, an annual publication of BBS;

1.2.2 Crop Estimation Reporting System

Selected sample clusters are visited four times in a year and crop-cutting experiments are conducted in due time to estimate the major crops production of Bangladesh. A well-defined Crop Calender is followed to collect data in the field level throughout the year. The collected data is processed, compiled at head office. The findings are disseminated after approval of competent authority.

1.2.3 Type of Estimation

Both subjective (household based interview) and objective (direct observation) methods are used to obtain crop estimates. The subjective method denotes the estimates based on impression. The objective method denotes the method of sample survey in which the main items of information are collected mostly through measurement and observation. The estimates of rice, wheat, potato and jute are made by objective method; for all other crops subjective estimation are followed.

1.2.4 The Subjective Estimation Method

Crop estimation is usually initiated at union levels. The upazila statistical office staff collects the union estimates of the area and yield rate of the crop being estimated. These crop estimates are prepared on the basis of assessment of opinions of farmers interviewed and appraisals of the current crop conditions compared with that of the previous year or of a normal year by the field staff of the upazila statistical office. The Agricultural Censuses conducted in 1983-84, 1996 and 2008 influence the current estimates of crop areas.

In order to have an element of objectivity in estimation, the field offices of BBS collect area and yield rate of a crop by unions on the basis of assessments of reports of 5 local farmers and their observation of condition of crops in the field. Percentage changes of area of yield rate from previous year are determined on information collected from farmers and field staff's own observation of a crop. Thus, the ratio estimation methodology is followed to get current year estimates.

Upazila crop acreage is the arithmetic sum of union crop acreage and yield per acre is the result of weighted average of union estimates. District estimates are evaluated in relation to (1) prices of crops (2) seasonal characteristics, (3) conditions of the growing plants, (4) damages(if any) and (5) previous year estimates. The country estimates are based on district estimates.

1.2.5 The Objective Estimation Method

Cultivations of Aus, Aman, Boro, Wheat, Potato and Jute are widespread. The sample designs of these crops are, therefore, developed considering total land area of the country (excluding urban areas and areas under government reserved forests and big rivers) as universe. The each unit of clusters of plots are sampled across this universe. In order to conduct crop estimation survey for six main crops, BBS uses a total of 10348 clusters each constituted 5 acres of land on an average throughout the country as sample frame. The district is considered as the domain of estimation while the upazilas in a district are considered as strata. The clusters were allocated among the districts proportionately to the size of the district with restriction that the number of cluster in a district is at least 150. At least one cluster was chosen from each union of a upazila. The clusters were formed from cadastral plot listed in the land records. A cluster may have many crops & non-crops plots, each of which has it's own identification number referred to ID number. For each cluster, BBS maintains and updates the list of farmers having fields within the cluster as well as other relevant information regarding farming.

1.2.6 Data Collection

The clusters are visited 4 times a year. The acreages of different crops and other utilizations in each cluster are recorded by the field staff in prescribed forms.

1.2.7 Area Estimation

Sample design for estimating the area of each six main crops: For each six crops, stratified two stage random sampling designs are used. The sample design for each main crop is as follows;

Area under particular crop in clusters is given by

$$P = \frac{\text{area under the crop}}{\sum_{i=1}^{Nd} ai} = \frac{a'}{\sum_{i=1}^{Nd} ai}$$

Area under particular crop (each six main crop) in district d is given by

$$\hat{A}_d = NP$$

The cluster term reports are edited, compiled and analyzed in head office for estimating areas of Aus, Aman, Boro, Wheat, Potato and Jute crops by varieties separately and combinedly. The total acreage figure of a crop is obtained districtwise by using the method of ratio estimation. The acreage estimates of crops by district are obtained by ratio method of expansion as follows;

Area for a crop for the district	=	Effective area for the district	x	Area ratio devoted to the crop for the district
----------------------------------	---	---------------------------------	---	---

Where,

Effective area for the district	=	Total land area for the district	-	Area not utilized for agricultural purposes for the district
---------------------------------	---	----------------------------------	---	--

1.2.8 Yield Rate Estimation

For estimating yield rates of the main crops (Aus, Aman, Boro, Wheat, Potato and Jute), sample crop cutting surveys are conducted. A large sub-sample of clusters is taken for each of the survey. The sampling design for yield estimation of each main crop is stratified two-stage random sampling design with different districts in the country serving as domains of study. Different upazilas are considered the strata. In each district 50 (fifty) sample crop cutting experiments are done in the sample cluster. The total number of crop cutting is distributed among the upazilas (sub-districts) according to the proportion of area coverage for each crop in the previous year. The first stage units (FSUs) of the sample design are the selection of clusters of land where crop is grown. A field (the smallest demarcated area in a cluster) in the cluster is the second stage sampling unit (SSU). A plot (crop cutting area) in the field where the crop under study grown is reflected for conducting crop cutting experiment.

District Level Estimate

Weighted average yield of the crop in d-th district,

$$\bar{y}_d = \frac{\sum_h^L A_{dh} \bar{y}_{dh}}{\sum_h^L A_{dh}}$$

is the estimator of rice yield for the district

Where, \bar{y}_d = average yield of crop in district d

A_{dh} = total crop area in h-th stratum of district d

\bar{y}_{dh} = average yield of crop in the h-th stratum of district d

The district level variance of yield estimator is given by

$$V(\bar{y}_d) = \frac{1}{A_d^2} \sum_h^L A_{dh}^2 \left(\frac{1}{n_{dh}} - \frac{1}{N_{dh}} \right) S_{dh}^2$$

The district level estimate of variance is given as:

$$\hat{V}(\bar{y}_d) = \frac{1}{A_d^2} \sum_h^L A_{dh}^2 \left(\frac{1}{n_{dh}} - \frac{1}{N_{dh}} \right) s_{dh}^2$$

The estimated percentage standard error at the district level is given as:

$$\widehat{CV}_d = \frac{\sqrt{\hat{V}(\bar{y}_d)}}{\bar{y}_d} \times 100$$

Where, N_{dh} = total of fields growing specific crop in h-th stratum of district d

n_{dh} = sample number of fields growing specific crop in h-th stratum of district d

A_d = total estimated area of specific crop in district d

S_{dh}^2 = sample variance from h-th stratum of district d

National Level Estimate

The overall weighted yield estimate at the national level is given by:

$$\bar{y} = \frac{1}{A} \sum_d^D A_d \bar{y}_d$$

The overall estimate of variance is given by:

$$\hat{V}(\bar{y}) = \frac{1}{A^2} \sum_d^D A_d^2 \hat{V}(\bar{y}_d)$$

The overall estimated percentage standard error is given as:

$$CV = \frac{\sqrt{\hat{V}(\bar{y})}}{\bar{y}} \times 100$$

Sample Crop Cutting Method of Rice (Aus, Aman & Boro)

The method followed is a circular cut of total area 215.278 sq. ft. (20 sq meters) with a radius of 8.278 ft,. In sample plot selected following statistical procedure, one random point is determined and keeping that point in the centre, the circle is delineated by means of an appliance with an arm of fixed length (8.278 ft.) attached to it. A stylus is also attached for marking crop plants to be cut. Rice from the harvested sample plants is threshed and winnowed and green weights are recorded. For recording the moisture, moisture meter is used. In Bangladesh 14% moisture in the case of paddy is considered as standard after drying. The formula for conversion of produce of paddy into rice followed in Bangladesh is given below:

$$\text{Rice} = \text{paddy} \times \frac{2}{3}$$

Sample Crop Cutting Method of Wheat

The sample crop cutting is conducted in the selected plot in the cluster. The sample plot (area of crop cutting) is determined following statistical procedure. The method followed is a circular cut of total area 50 sq. feet (approx) with a radius of 4 ft. Wheat from the harvested sample plants is threshed and winnowed and green weight and weight after drying is recorded. Thus, the weighted yield of wheat per area is obtained.

Sample Crop Cutting Method of Potato

To conduct sample crop cutting for potato, a field in the randomly selected cluster is randomly selected. As potato is planted in rows, two rows are randomly selected among total. Then the area under selected row is measured through adding the length in feet of each selected row multiplied by the average width per row in the field. Afterwards the Potato for selected two rows are harvested and cleaned. Then taking the harvested area and the weight of harvested Potato into consideration, the yield rate per acre is estimated.

Sample Crop Cutting Method of Jute

The sample crop cutting is conducted in the selected plot of the selected cluster. The sample plot (area of crop cutting) is determined following statistical procedure. The method followed is a circular cut having total area of 50 sq. feet (approx) with a radius of 4 ft. The bundle of jute is kept under water for few days. After somedays the rotten Jute is separated from the stalks, cleaned and dried. Then the weight is taken and the yield per acre is estimated.

1.2.9 Production Estimation

Multiplying area and yield rate figures, production estimates of the crops are derived separately for each district. Country estimates are obtained summing up estimates of districts. Yield rates at country level are all weighted averages of district figures.

AEZ-24: St. Martin's Coral Island

This small but distinctive region occupies the whole of St. Martin's Island in the extreme south of the country. The area has very gently undulating old beach ridges and inter-ridge depressions surrounded by sandy beaches.

The soils are developed entirely on old and young coral beach sands. Calcareous Alluvium is the only general soil type of the area. General fertility level is low with poor moisture holding capacity.

Location: St. Martin's, Island

AEZ-25: Level Barind Tract

This region is developed over Madhupur Clay. The landscape is almost level and locally irregular along river channels. The predominant soils have a grey silty paddled topsoil with plough pan which either directly overlies grey heavy little weathered Madhupur Clay or merges with the porous silt loam or silty clay loam subsoils having strongly acid clay at greater depth. Shallow Grey Terrace soils and Deep Grey Terrace soils are the major components of general soil types of the area. The soils are low in available moisture holding capacity and slightly acidic to acidic in reaction. Organic matter status is very low and most of the available nutrients are limiting.

Location: Dinajpur, Gaibandha, Joypurhat, Bogura, Naogaon, Sirajganj and Natore districts.

AEZ-26: High Barind Tract

It includes the western part of Barind Tract where the underlying Madhupur Clay has been uplifted and cut into by deep valleys.

The soils include paddled silt loam to silty clay loam in the topsoils and porous silt loam with mottled plastic clay at varying depth. Deep Grey Terrace soils and Grey Valley soils are the major components of general soil types of the area. General fertility status is low having low status of organic matter.

Location: Rajshahi, Chapainawabgonj and Naogaon districts.

AEZ-27: North Eastern Barind Tract

This region occupies several discontinuous areas on the north-eastern margins of Barind Tract. It stands slightly higher than adjoining floodplain land.

The region has silty or loamy topsoil and clay loams to clay subsoils and grades into strongly mottled clay. The Madhupur Clay underlying this region is deeply weathered. Deep Red Brown Terrace soil and Deep Grey Terrace soils are the major components of general soil types of the area. The soils are strongly acidic in reaction. Organic matter of the soils is low. General fertility level is poor.

Location: Dinajpur, Rangpur, Gaibandha, Joypurhat and Bogura districts.

AEZ-28: Madhupur Tract

This region of complex relief and soils developed over the Madhupur Clay. The landscape comprises level upland, closely or broadly dissected terrace associated with either shallow or broad, deep valleys.

Eleven general soil types exist in the area; of which, Deep Red Brown Terrace, Shallow Red Brown Terrace soils and Acid Basin Clays are the major ones. The soils on the terrace are better drained, friable clay loams to clays overlying friable clay substratum at varying depth. Soils in the valleys are dark grey heavy clays. They are strongly acidic in reaction with low status of organic matter, low moisture holding capacity and low fertility level.

Location: Dhaka, Gazipur, Narsingdi, Narayanganj, Tangail, Mymensingh and Kishoreganj.

AEZ-29: Northern and Eastern Hills

This region includes the country's hill areas. Relief is complex. Hills have been dissected to different degrees over different rocks. In general, slopes are very steep and few low hills have flat summits.

The major hill soils are yellow-brown to strong brown permeable friable loamy, very strongly acidic and low in moisture holding capacity. However, soil patterns generally are complex due to local differences in sand, silt and clay contents of the underlying sedimentary rocks and in the amount of erosion that has occurred. Brown Hill soils are the predominant general soil type of the area. Organic matter content and general fertility level is low.

Location: Mainly in Khagrachhari, Chattogram Hill Tracts, Bandarban, Chattogram, Cox's Bazar, Habiganj and Moulvi Bazar districts, small areas along the northern border of Sherpur, Mymensingh, Sunamganj and Sylhet districts in central and south eastern Sylhet and in the east of Brahmanbaria, Cumilla and Feni districts.

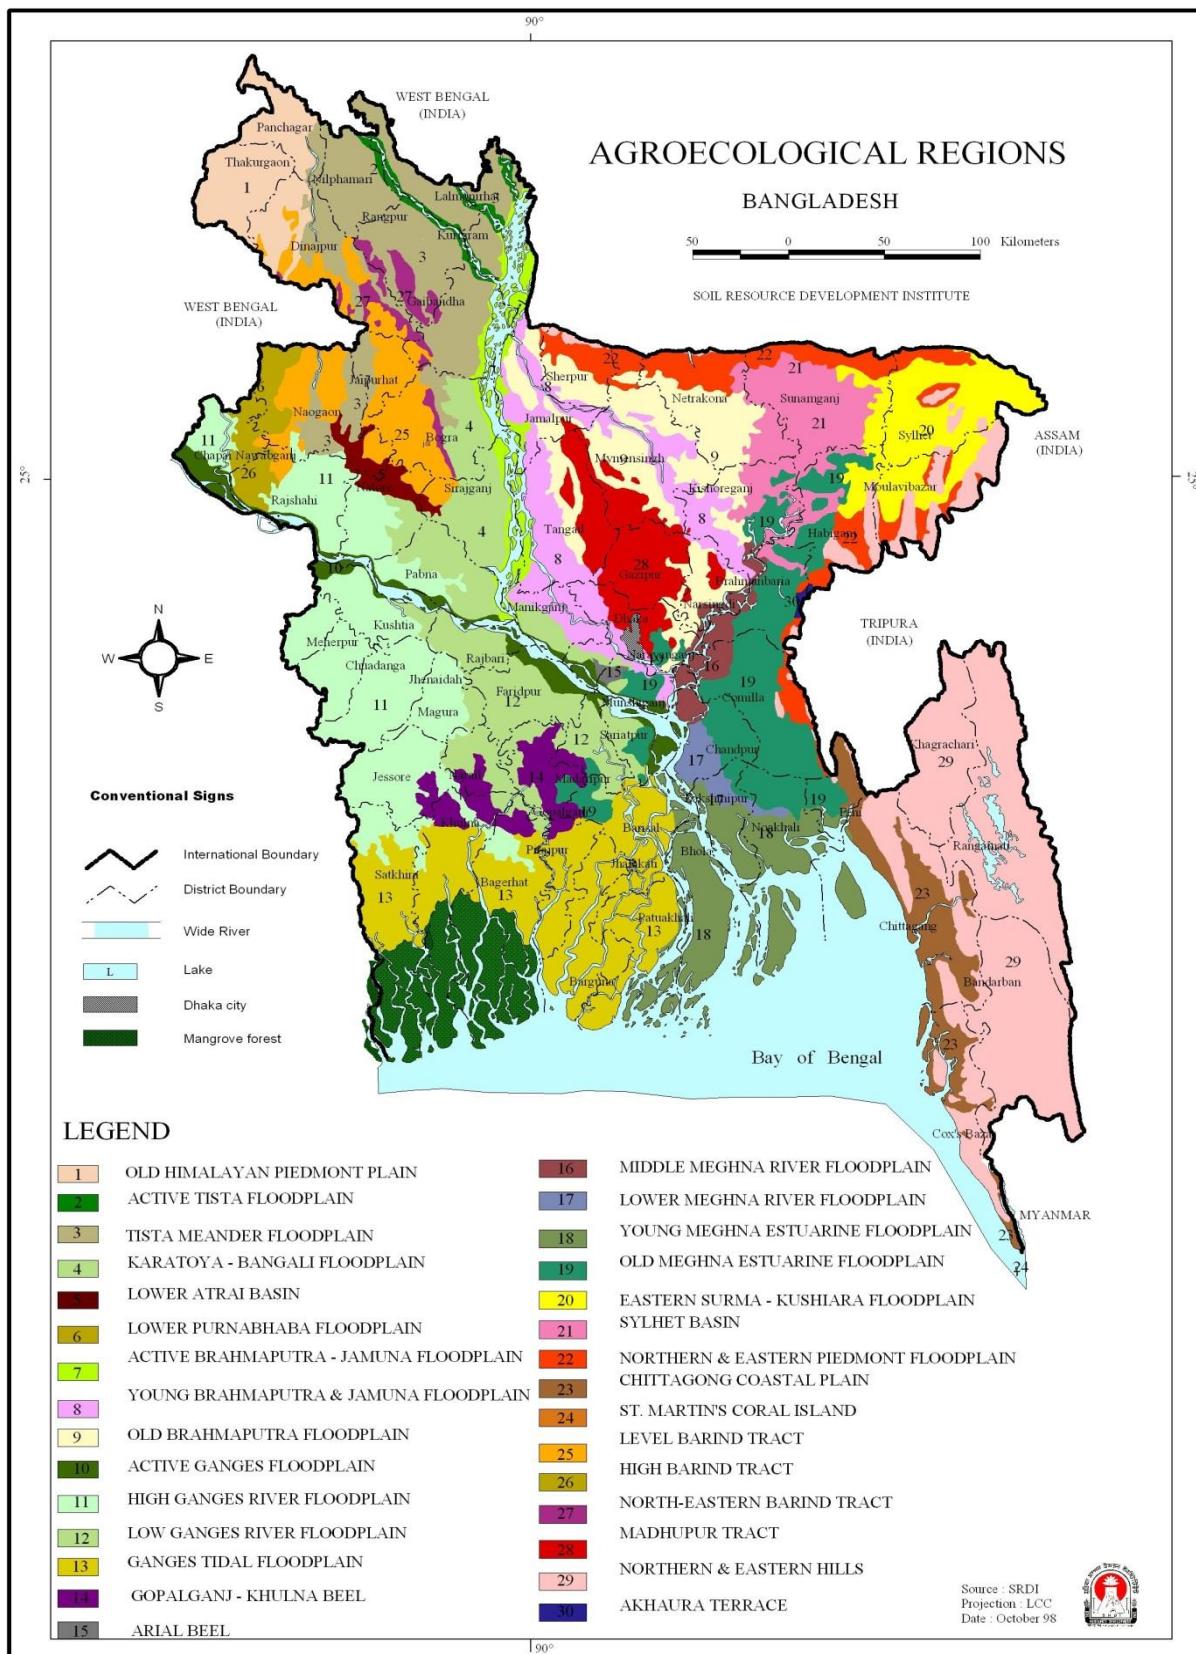

AEZ-30: Akhaura Terrace

This small region lies on the eastern border of Brahmanbaria and southwest corner of Habiganj districts. In appearance, the region resembles Madhupur Tract with level upland dissected by mainly deep broad valleys.

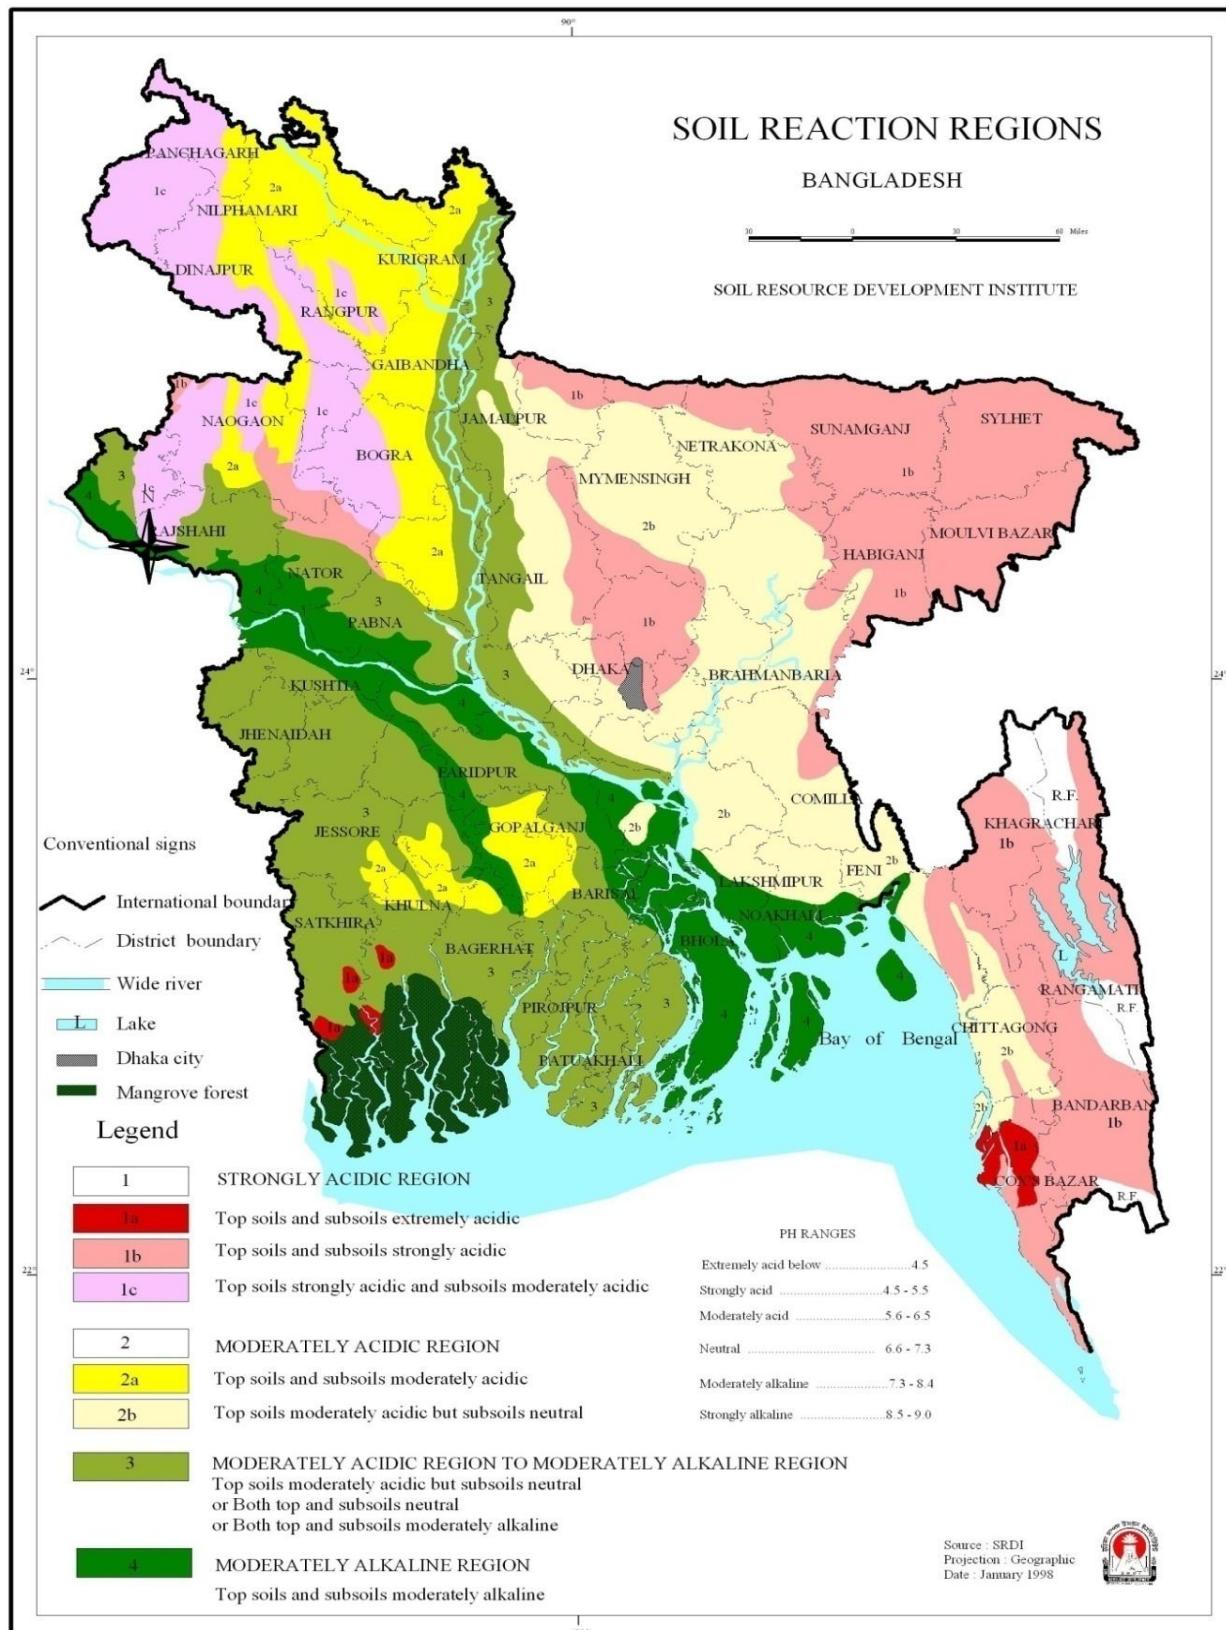

The main soils on the upland have strong brown clay which grades into red mottled clay substratum. The valley soils range from silty clay loams to clays. Deep Red Brown Terrace soil, Grey Piedmont soils and Acid Basin Clays are the major components of general soil types of the area. The general fertility including organic matter status is low. The soils are strongly acidic in reaction.

Location: Brahmanbaria district and minor area in Habiganj district.

All the physiographic units and agro-ecological zones are displayed separately on two maps (Map-1 and Map-2).

1.5 Land Levels in Relation to Flooding

. The information has been provided in terms of depth of flooding phases. The terms used have the following meanings:

Highland (H)	: Land which is above normal flood-level.
Medium Highland (MH)	: Land which is normally flooded about 90 cm deep during the flood season.
Medium Lowland (ML)	: Land which is normally flooded between 90 cm. and 180 cm. deep during the flood season.
Lowland (L)	: Land which is normally flooded between 180 and 300 cm deep during the flood season.
Very Lowland (VL)	: Land which is normally flooded deeper than 300 cm during the flood season.

An additional class, Bottomland, is recognized for depression sites in any land level class which remains wet throughout the year. The Medium Highland land type has been divided into two subclasses: MH-1, normally flooded upto about 30 cm deep; and MH-2, normally flooded between 30 -90 cm deep. Neither these subclasses nor Bottomland are shown separately on the map.

It is important to realize that the depth limits between the depth of flooding classes are not as rigid as the definitions might suggest. Flood-levels in an area may, in fact, vary by as much as a metre or more over different years. They may also reach their peak levels for only a few days at a time during a particular year. They may also reach their peak levels for only a few days at a time during a particular year. What these classes indicate is the level of flooding which farmers expect when they decide which crops to grow in the kharif season on their different kinds of land, based on their long experience of cultivation on particular sites:

- Highland may be suitable for kharif or perennial dry land crops if the soils are permeable. Impermeable soils - or soils which can be made impermeable by puddling - may be suitable for transplanted Aus and/or Aman paddy if bunds are made to retain rainwater on fields.
- Medium Highland is suitable for crops which can tolerate shallow flooding, such as broadcast or transplanted Aus paddy, jute and transplanted Aman paddy. Early kharif dry land crops which mature before flooding starts can be grown on permeable soils, and late kharif and early rabi dry land crops on soils which drain in September-October.
- Medium Lowland is flooded too deeply for transplanted Aus or transplanted Aman paddy to be grown safely. Mixed broadcast Aus and deepwater Aman is a common practice; or long Aman seedlings may be transplanted if floodwater recedes early enough. Dry land rabi crops are widely grown on soils which drain in October or November.
- Lowland is flooded too deeply for broadcast Aus or transplanted Aman to be grown. Deepwater Aman is typically grown on such land (although the cultivation of irrigated Boro paddy on such land in the dry season now precludes the cultivation of deepwater Aman over considerable areas of lowland). Dry land rabi crops can only be grown if floodwater recedes before December.

- Very Lowland generally is too deeply flooded for even deepwater Aman to be grown (this is not necessary because of the depth of flooding but because of such associated characteristics as early flooding, rapid flooding or wave action on large open bodies of water, as in the Sylhet Basin). Where cultivated, very Lowland is generally used for irrigated Boro paddy, either HYV or local varieties.
- Bottomland stays too wet for paddy to be sown broadcast. The traditional crop on such land is local Boro paddy, either not irrigated or irrigated by traditional low-lift irrigation devices. In a few other areas where flooding normally does not exceed about 1.5 m deep very long Aman paddy seedlings are transplanted early in the monsoon season.

The above flood-depth classes are shown on the map as subdivisions of the soil units. As with the soil units themselves, it must be realized that the information given on flooding characteristics is highly generalized. It is to be noted that several flood-depth classes can occur within a single village in floodplain physiographic units. But the map shows either the most extensive class (or classes) occurring in the soil unit (e.g., Highland or Highland and Medium Highland) or the range of classes which cover important areas within the unit if more than two classes occur (e.g., Medium Lowland to Very Lowland). Where two classes are named, the more extensive one is named first. Where a range of classes is indicated, they are referred in sequence from highest to lowest position in the landscape, regardless of their relative extents.

1.9 Physiography of Bangladesh

Bangladesh forms the largest delta in the world and is situated between $88^{\circ}10'$ and $92^{\circ}41'$ East longitudes and between $20^{\circ}34'$ and $26^{\circ}38'$ North latitudes. The great delta is flat throughout and stretches from near the foot-hills of the Himalayan Mountains in the north to the Bay of Bengal in the south.

The vast plain is washed by mighty rivers-the Meghna, the Padma, the Jamuna and the Karnafuli and their numerous tributaries. Tropical monsoon rains drench the land and the rivers. Onrush of rain waters in summer overflows their banks flooding low and outlying areas every year.

The monotony of flatness has been relieved inland by two elevated tracts-the Modhupur and the Barind tracts, and on the north-east and south-east by rows of hilly forests. The great plain lies almost at sea level along the southern coast and rises gradually towards north. The maximum elevation above the mean sea level is 4034 feet at Keocradang Hill in Rangamati Hill district. The topography, however, variable and can be divided into the following five classes.

1. High Land

The area is relatively high and cannot hold waters during monsoon. Some waters are retained by raising "bandhs" around fields. The area spreads over Modhupur Garh in Tangail and Mymensingh district, Bhaoal's Garh in Gazipur and Dhaka district, Barind tract in Rajshahi Division, Lalmai area in Cumilla and "Tilla" areas in Sylhet, Moulvi Bazar and Habiganj district.

2. Medium Highland

The land which is normally flooded up to about 90 cm. depth during the rainy season for more than two weeks continuously. The area spreads over Barishal division, major parts of Khulna division, northern part of Rajshahi division and parts of Gazipur, Narsindi, Noakhali, Feni, Lakshmipur, Cumilla and Habiganj district.

3. Medium Lowland and Low Land

Medium Lowland is normally flooded between 90cm. and 180 cm. depths and low land is normally flood between 180cm. and 275 cm. depth during the monsoon season. The area spreads over major parts of Cumilla, Brahmanbaria, Chandpur, Gopalgonj district and parts of Laksmipur, Noakhali, Serajganj, Natore and Naogaon district, northern parts of Khulna and Bagherhat district, minor of Jashore, Kishorganj and Habiganj district.

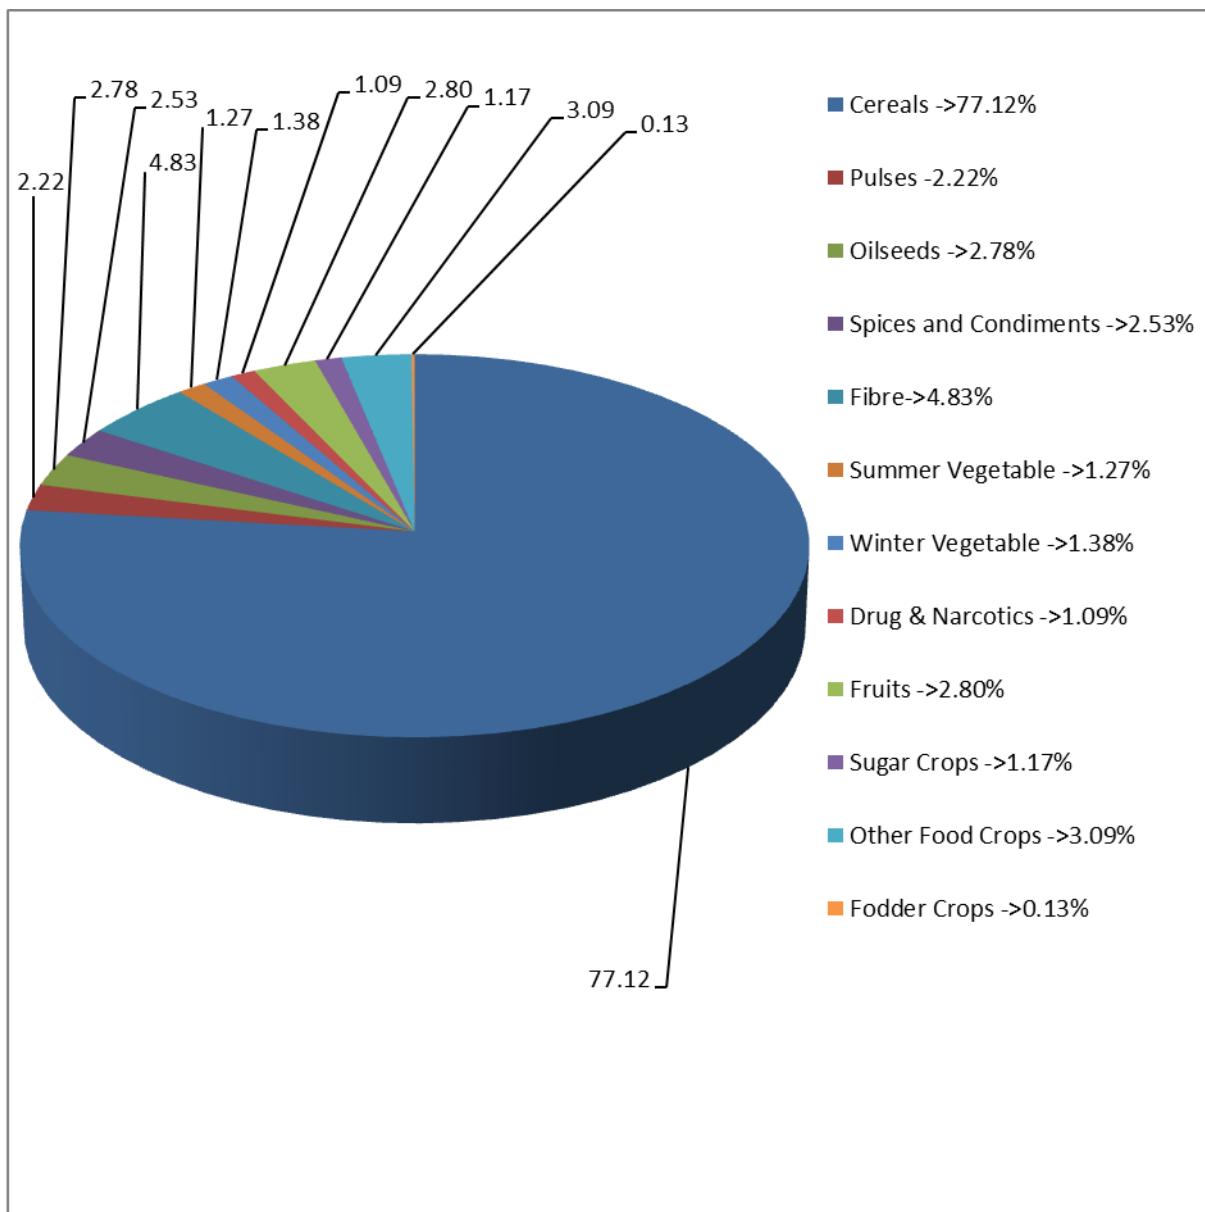

4. Very Low Land

The land consists of haors, bills, canals and other low lying areas which looks like large lakes during rainy season. Depth of water may rise as high as 30 feet. In winter, waters dry up except in the centre. Most of the haors and bills lie in Sylhet division and in Kisoreganj and Netrokona district.

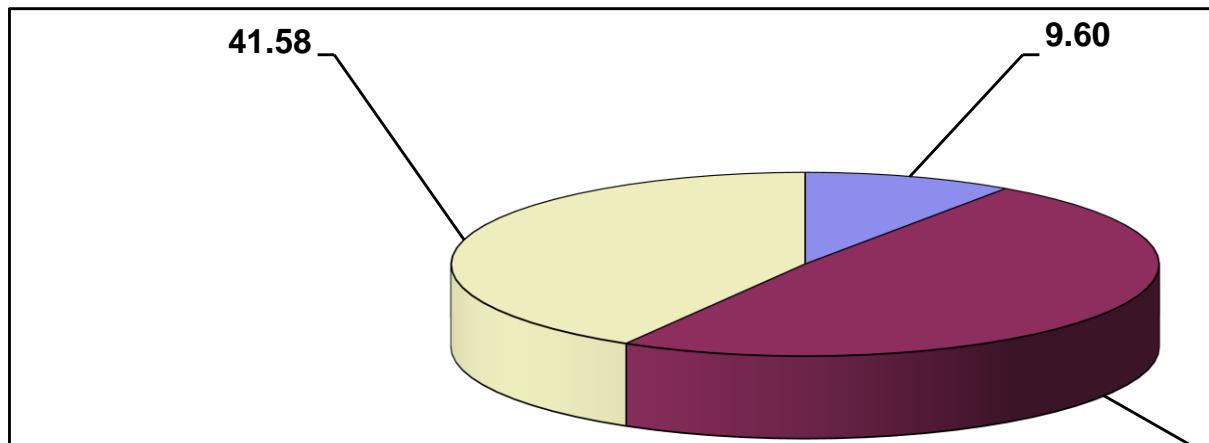

5. Hilly Land

The land spreads over Rangamati, Bandarban and Khagrachari Hill Districts, parts of Chattogram, northern parts of Mymensingh, north and southern parts of Sylhet division, eastern border of Cumilla and north eastern strip of Feni district.

Estimates of Aus Rice, 2018-2019

Introduction:

Aus is one of the major crops in Bangladesh. It has been contributing to food production in addition to other two rice (Aman and Boro) crops. The weather condition for Aus cultivation was favorable in this year but due to lower productivity as compared to two other rice crop Aman and Boro, farmers are reluctant to produce Aus. The contemporary crops are becoming profitable day by day.

In a subjective manner, farmers were interviewed on some management issues of seed and fertilizer. They opined that due to government support as well as favorable weather conditions, the production of rice remains almost same in relation to the previous year.

Area:

Total area under Aus crop has been estimated at 11.05 million hectares this year as compared to 10.75 million hectares in last year which is 2.82% higher than that of last year. The total area of this year and the last year of Aus by variety are as follows;

Table 1: Estimates of Total Area by Type of Aus Crop

Variety	2017-2018		2018-2019		Percentage (%) changes over previous year
	Area (in acres)	Area (in hectares)	Area (in acres)	Area (in hectares)	
Local Aus	3,96,308	1,60,377	4,33,685	1,75,503	(+) 9.43
HYV Aus	22,60,276	9,14,684	22,97,691	9,29,825	(+) 1.66
Total Aus	26,56,584	10,75,061	27,31,376	11,05,328	(+) 2.82

(Contd.)

Yield Rate:

Average yield rate of 2018-2019 has been estimated at 2.511 metric tons per hectare which is 0.36% lower than that of last year. Estimates of yield rates by varieties and combined average yield rate of all varieties are as follows;

Table 2 : Estimates of Yield Rates by Type of Aus Crop

Note: Above total figures are weighted figures

Production:

Total Aus production of 2018-2019 has been estimated at 2.77 million metric tons as compared to 2.70 million metric tons in last year which is 2.43% higher. Estimates of production by varieties and combined total of Aus are as follows:

Estimates of Aman Rice, 2018-19

Introduction :

Aman is one of the main crops in Bangladesh. It is the second largest rice crop in the country in respect to the volume of production while Boro remains the top. It is notable that the area coverage of Aman is the largest as a single crop and Boro remains the second. The production of Aman depends on the weather condition of the country and farmers usually cultivate Aman in their land.

In the year 2018-19, favorable weather condition prevailed all over the country from sowing to harvesting period of Aman. In a subjective manner, farmers were interviewed on some points relating to management system of seed, fertilizer, and rural electricity supply. They opined that proper management and timely distribution of seed, fertilizer, uninterrupted supply of electricity, adequate surface water led to increase in area production of Aman rice in 2018-19.

Area:

Total area under Aman crop has been estimated 1,38,92,398 acres 56,21,949 hectares this year (2018-19) as compared to 1,40,34,504 acres 56,79,456 hectares of last Year (2017-18). The harvested area has decreased 1.01% by this Year. Comparative area estimates are shown below:

Estimates of Boro Rice 2018-19

Introduction

Boro is the most important and single largest crop in Bangladesh in respect of volume of production. It has been persistently contributing to higher rice production in last successive years. The weather condition for Boro cultivation was favorable in the growing stage of this year.

In a subjective manner, farmers were interviewed on some points relating to management system of seed, fertilizer and rural electricity supply. They opined that proper management and timely distribution of seed, fertilizer and stable supply of electricity led to higher yield of boro this year.

Area

Total area under Boro crop has been estimated at 118,32,309 acres (47,88,276 hectares) in this year (2018-19) as compared to 120,07,983 acres (48,59,367 hectares) of the last year (2017-18). The harvested area has decreased by 1.46 % this year. Comparative area estimates are shown below:

Estimates of Wheat, 2018-19

Introduction

The cultivation of wheat decreases this year (2018-19) in Bangladesh in relation to last year (2017-18). Farmers interest on the cultivation of more profitable contemporary crops is considered as the main reason for decrease in wheat cultivation in the country. The weather condition was favorable in this year during sowing and harvesting period. According to the field reports it is observed that good management and distribution system of seed and fertilizer brings satisfactory yield rates of this crop.

Area

Total area under wheat crop has been estimated at 8,16,322 acres (3,30,348 hectares) in this year (2018-19) as compared to 8,67,884 acres (3,51,213 hectares) of last year (2017-18). Comparative area estimates of this year (2018-19) as well as last year (2018-19) are shown below;

Estimates of Total Area of Wheat Crop

Crop	2017-2018		2018-2019		Percentage changes over previous year
	Area (in acres)	Area (in hectares)	Area (in acres)	Area (in hectares)	
Wheat	8,67,884	3,51,213	8,16,322	3,30,348	(-) 5.94%

Yield

Average yield rate of wheat of the financial year (2018-19) has been estimated at 33.37 maunds per acre (3.078 metric tons per hectare) which is 1.66 % lower than that of last year (2017-18). Estimated yield rates of this year as well as last year are shown below ;

Total Wheat	33.94	3.130	33.37	3.078	(-) 1.66 %

Production

Total wheat production of the financial year (2018-19) has been estimated at 10,16,811 metric tons as compared to 10,99,373 metric tons of the last year (2017-18), which is 7.509% lower. Estimates of production of this year and last year are as follows;

Estimates of Jute 2018-2019

Introduction:

Jute is an eminent cash crop of Bangladesh. Farmers of some regions cultivate jute on regular basis. In a subjective manner, farmers were interviewed relating to cultivation of jute. They opined that due to unfavorable weather condition, jute cultivation has persistently decreased this year. Moreover, due to incessant rain during the Bangla month of Chaitra, the sowing season of jute seeds, increasing Boro paddy cultivation the production of Jute decreased now-a-days.

Area:

Total area under jute crop has been estimated at 18,52,479 acres (7,49,658 hectares) in this year which is 1.13% lower than that of last year. Comparative area estimates of jute crop of 2017-18 and 2018-19 are as follows:

Table-1: Estimates of Total Area of Jute Crop

2017-18		2018-19		Change over previous year (%)
Area (in acre)	Area (in hectare)	Area (in acre)	Area (in hectare)	
18,73,632	7,58,218	18,52,479	7,49,658	(-) 1.13

Yield Rate:

Average yield rate has been estimated at 4.63 bales per acre (11.440 bales per hectare) in this year which is 2.47% lower than that of last year. Average yield rate of this year as well as the last year are provided as follows:

Table-2: Estimates of Yield Rate of Jute Crop

2017-18		2018-19		Change over previous year (%)

4.75	11.731	4.63	11.440	(-) 2.47

Note: Above total figures are weighted figures.

(Contd.)

Production:

Total jute production in this year has been estimated at 85,76,087 bales which is 3.58% lower than that of last year. Total production figures of this year and the last year are as follows:

Table 3: Estimates of Total Production of Jute Crop.

Production (Bales)		Change over previous year (%)
2017-18	2018-19

Estimates of Potato, 2018-19

Introduction

Potato is a prominent crop in consideration of production and its internal demand in Bangladesh. Potato cultivation has been getting popular over the last many years. The weather condition for potato cultivation was favourable during the sowing, growing and harvesting period of the survey year 2018-19. The area of local variety remained almost same with regard to previous year. It was found that the farmers were interested to grow more high yielding variety.

In a subjective manner, farmers were interviewed on some points relating to management and distribution system of seed and fertilizer. They opined that proper management and timely distribution of seed and fertilizer led to a substantial higher production this year (2018-19). At the same time no natural calamity was reported during potato cultivation and its harvesting. As a result, the yield rate has significantly increased, which contributed 0.99% increase in total yield.

Area

Total area under potato crop has been estimated 11,57,402 acres (4,68,375 hectares) in this year (2018-19) as compared to 11,79,703 acres (4,77,400 hectares) of the last year (2017-18). Comparative area estimates of potato are shown below;
